AN AGE OF CROSS-CULTURAL INTERACTION, 1000 TO 1500 C.E.

The half millennium from 1000 to 1500 C.E. differed markedly from earlier eras. During classical and postclassical times, large, regional societies situated in China, India, southwest Asia, and the Mediterranean basin dominated the eastern hemisphere. Peoples of these lands built extensive networks of trade and communication that spanned the eastern hemisphere and influenced the development of all its societies. From 1000 to 1500 C.E., however, nomadic Turkish and Mongol peoples overran settled societies and established vast transregional empires from China to eastern Europe.

Nomadic peoples toppled several postclassical states, most notably the Song empire in China and the Abbasid realm in southwest Asia. By building empires that transcended the boundaries of postclassical states, however, nomadic Turks and Mongols laid a political foundation for sharply increased trade and communication between peoples of different societies and cultural regions. Indeed, their empires prompted the peoples of the eastern hemisphere to forge closer links than ever before in history. By the mid-fourteenth century, merchants, diplomats, and missionaries traveled frequently between lands as far removed as Italy and China.

Increased trade in the Indian Ocean basin also promoted more intense cross-cultural communications. Maritime trade built on the political stability, economic expansion, and demographic growth of the postclassical era. By the fourteenth century, mariners called at ports throughout the Indian Ocean basin from southeast Asia to India, Ceylon, Arabia, and east Africa, while sea-lanes through the South China Sea offered access to ports in the islands of southeast Asia, China, Japan, and Korea. Commercial goods traveled over the Indian Ocean in larger quantities than ever before. From the eleventh century forward, cargoes increasingly consisted of bulky commodities such as timber, coral, steel, building materials, grains, dates, and other foodstuffs. This trade in bulk goods indicated a movement toward economic integration as societies of the Indian Ocean basin concentrated increasingly on cultivating crops or producing goods for export while importing foods or goods that they could not produce very well themselves.

Demographic growth, increased agricultural production, and economic expansion helped to underwrite rapid political development in sub-Saharan Africa and western Europe. Powerful regional states and centralized empires emerged in west Africa and central Africa, and a series of wealthy city-states dominated the east African coast. In western Europe the decentralized states of the early middle ages evolved into more tightly centralized regional states. Rulers in several of these states were able to organize networks of military retainers and political supporters who strengthened the claims of central au-
thorities against local challengers. Increasing volumes of trade favored this movement toward centralization in sub-Saharan Africa and western Europe, since taxes levied on trade helped to finance the professional bureaucrats and armed forces that centralized states required.

Although they did not participate in the demographic and economic expansion of the eastern hemisphere, the indigenous peoples of the Americas and Oceania also built larger and more centralized societies from 1000 to 1500 C.E. Centralized empires appeared in Mesoamerica and Andean South America, while agricultural societies emerged in several regions of North America. Even in the absence of large domesticated animals, trade networks linked peoples as far distant as Mexico and the Great Lakes region. Pacific island societies also moved toward tighter political organization. Because they lived on small land bases distributed irregularly throughout a vast ocean, Pacific islanders had no realistic possibility of building large imperial states. Within their own agricultural and fishing societies, however, they established tightly centralized kingdoms that organized public affairs and sponsored distinctive cultural traditions.

During the fourteenth and fifteenth centuries C.E., much of the eastern hemisphere experienced difficulties not only because of warfare arising from the conquests of nomadic peoples but also because of epidemic bubonic plague and global climatic changes that brought cooler temperatures. In building their transregional empires, nomadic peoples sometimes devastated the lands that they conquered, throwing societies and economies into turmoil. While facilitating trade and travel, nomadic empires also made it possible for diseases to spread rapidly over long distances, and during the fourteenth century, epidemic bubonic plague became a hemispheric phenomenon. Meanwhile, cooler weather resulted in lower agricultural yields in many lands, and in some far northern lands, it made agriculture impractical. Together with military destruction and pandemic plague, reduced agricultural production led to political, social, and economic problems throughout much of the eastern hemisphere.

Nevertheless, by the mid-fifteenth century, peoples from China to western Europe were recovering from those difficulties and rebuilding prosperous societies. In their own quest for prosperity, western European peoples unwittingly laid the foundations of a new era in world history. While searching for sea routes to Asian markets, European mariners happened on the continents of North and South America. They soon ventured into the Pacific Ocean, where they found their way to Australia and the Pacific islands. Their voyages brought the world’s various peoples for the first time into permanent and sustained communication with one another, and their interactions triggered a series of consequences that profoundly influenced modern world history. The European voyages that gave rise to this interdependent and interconnected world took place precisely because of the movement toward increasing interaction in the eastern hemisphere during the centuries following 1000 C.E. The period from 1000 to 1500 C.E. set the stage for the modern era of world history.
18
Nomadic Empires and Eurasian Integration
Guillaume Boucher was a goldsmith who lived during the early and middle decades of the thirteenth century. At some point, perhaps during the 1230s, he left his native Paris and went to Budapest, which was then a part of the kingdom of Hungary. There he was captured by Mongol warriors campaigning in Hungary. The Mongols noticed and appreciated Boucher's talents, and when they left Hungary in 1242, they took him along with other skilled captives to their central Asian homeland.

For at least the next fifteen years, Boucher lived at the Mongol capital at Karakorum. Though technically a slave, he enjoyed some prestige. He supervised fifty assistants in a workshop that produced decorative objects of gold and silver for the Mongol court. His most ingenious creation was a spectacular silver fountain in the form of a tree. Four pipes, concealed by the tree’s trunk, carried wines and other intoxicating drinks to the top of the tree and then dispensed them into silver bowls from which courtiers and guests filled their cups. Apart from his famous fountain, Boucher also produced statues in gold and silver, built carriages, designed buildings, and even sewed ritual garments for Roman Catholic priests who conducted services for Christians living at Karakorum while seeking converts in the Mongol empire.

Boucher was by no means the only European living at the Mongol court. His wife was a woman of French ancestry whom Boucher had met and married in Hungary. The Flemish missionary William of Rubruck visited Karakorum in 1254, and during his sojourn there he encountered a Frenchwoman named Paquette who was an attendant to a Mongol princess, an artisan from Russia (Paquette’s husband), an unnamed nephew of a French bishop, a Greek soldier, and an Englishman named Basil. Other European visitors to the Mongol court found Germans, Slavs, and Hungarians as well as Chinese, Koreans, Turks, Persians, and Armenians, among others. Many thirteenth-century roads led to Karakorum.

Nomadic peoples had made their influence felt throughout much of Eurasia as early as classical times. The Xiongnu confederation dominated central Asia and posed a formidable threat to the Han dynasty in China from the third to the first century B.C.E. During the second and third centuries C.E., the Huns and other nomadic peoples from central Asia launched the migrations that helped bring down the western Roman empire, and later migrations of the White Huns destroyed the Gupta state in India. Turkish peoples ruled a large central Asian empire from the sixth through the ninth century, and the Uighur Turks even seized the capital cities of the Tang dynasty in the mid-seventh century.

Between the eleventh and fifteenth centuries, nomadic peoples became more prominent than ever before in Eurasian affairs. Turkish peoples migrated to Persia, Anatolia, and India, where they overcame existing authorities and established new states. During the thirteenth century...
and fourteenth centuries, the Mongols established themselves as the most powerful people of the central Asian steppes and then turned on settled societies in China, Persia, Russia, and eastern Europe. By the early fourteenth century, the Mongols had built the largest empire the world has ever seen, stretching from Korea and China in the east to Russia and Hungary in the west.

Most of the Mongol states collapsed during the late fourteenth and fifteenth centuries, but the decline of the Mongols did not signal the end of nomadic peoples’ influence on Eurasian affairs. Although a native Chinese dynasty replaced the Mongol state in China, the possibility of a Mongol revival forced the new dynasty to focus attention and resources on its central Asian frontier. Moreover, from the fourteenth through the seventeenth century, Turkish peoples embarked on new campaigns of expansion that eventually brought most of India, much of central Asia, all of Anatolia, and a good portion of eastern Europe under their domination.

The military campaigns of nomadic peoples were sometimes exceedingly destructive. Nomadic warriors often demolished cities, slaughtered urban populations, and ravaged surrounding agricultural lands. Yet those same forces also encouraged systematic peaceful interaction between peoples of different societies. Between the eleventh and fifteenth centuries, the imperial campaigns of Turkish and Mongol peoples forged closer links than ever before between Eurasian lands. By fostering cross-cultural communication and exchange on an unprecedented scale, the nomadic empires integrated the lives of peoples and the experiences of societies throughout much of the eastern hemisphere.

**Turkish Migrations and Imperial Expansion**

Turkish peoples never formed a single, homogeneous group but, rather, organized themselves into clans and tribes that often fought bitterly with one another. Turkish clans and identities probably emerged after the Xiongnu confederation broke apart in the first and second centuries C.E. All Turkish peoples spoke related languages, and all were nomads or descendants of nomads. From modest beginnings they expanded their influence until they dominated not only the steppes of central Asia but also settled societies in Persia, Anatolia, and India.

**Nomadic Economy and Society**

Nomadic societies in central Asia developed by adapting to the ecological conditions of arid lands. Central Asia does not receive enough rain to support large-scale agriculture. Oases permit intense cultivation of limited regions, but for the most part only grasses and shrubs grow on the central Asian steppe lands, and there are no large rivers or other sources of water to support large-scale irrigation systems. Humans cannot digest grasses and shrubs, but grazing animals thrive on them. To take advantage of the vast open spaces of central Asia, nomads herded grazing animals, especially sheep and horses, but also cattle, goats, and camels.

Nomadic peoples drove their herds and flocks to lands with abundant grass and then moved them along as the animals thinned the vegetation. They did not wander aimlessly through the steppes but, rather, followed migratory cycles that took account of the seasons and local climatic conditions. They lived mostly off the meat, milk, and hides of their animals. They used animal bones for tools and animal dung as fuel for fires. They made shoes and clothes out of wool from their sheep and skins from their other animals. Wool was also the source of the felt that they used to fashion large tents called *yurts* in which they lived. They even prepared an alcoholic drink from animal products by fermenting mare’s milk into a potent concoction known as *kumiss.*
The aridity of the climate and the nomadic lifestyle limited the development of human societies in central Asia. Only at oases did agriculture make it possible for dense populations to congregate. Settlements were few and small—and often temporary as well, since nomads carried their collapsible felt yurts with them as they drove their herds. Nomads often engaged in small-scale cultivation of millet or vegetables when they found sources of water, but the harvests were sufficient only to supplement animal products, not to sustain whole societies. Nomads also produced limited amounts of pottery, leather goods, iron weapons, and tools. Given their migratory habits, however, both intensive agriculture and large-scale craft production were practical impossibilities.

Thus nomads avidly sought opportunities to trade with settled peoples, and as early as the classical era brisk trade linked nomadic and settled societies. Much of that commerce took place on a small scale as nomads sought agricultural products and manufactured goods to satisfy their immediate needs. Often, however, nomads also participated in long-distance trade networks. Because of their mobility and their familiarity with large regions of central Asia, nomadic peoples were ideally suited to organize and lead the caravans that crossed central Asia and linked settled societies from China to the Mediterranean basin. During the postclassical era and later, Turkish peoples were especially prominent on the caravan routes of central Asia.

Nomadic society generated two social classes: nobles and commoners. Charismatic leaders won recognition as nobles and thereby acquired the prestige needed to organize clans and tribes into alliances. Normally, nobles did little governing, since clans and tribes looked after their own affairs and resented interference. During times of war, however, nobles wielded absolute authority over their forces, and they dealt swiftly and summarily with those who did not obey orders.
The nobility was a fluid class. Leaders passed noble status along to their heirs, but the heirs could lose their status if they did not continue to provide appropriate leadership for their clans and tribes. Over the course of a few generations, nobles could return to the status of commoners who tended their own herds and followed new leaders. Meanwhile, commoners could win recognition as nobles by outstanding conduct, particularly by courageous behavior during war. Then, if they were clever diplomats, they could arrange alliances between clans and tribes and gain enough support to displace established leaders.

The earliest religion of the Turkish peoples revolved around shamans—religious specialists who possessed supernatural powers, communicated with the gods and nature spirits, invoked divine aid on behalf of their communities, and informed their companions of their gods’ will. Yet many Turkish peoples became attracted to the religious and cultural traditions they encountered when trading with peoples of settled societies. They did not abandon their inherited beliefs or their shamans, but by the sixth century C.E. many Turks had converted to Buddhism, Nestorian Christianity, or Manichaeism. Partly because of their newly adopted religious and cultural traditions and partly because of their prominence in Eurasian trade networks, Turkish peoples also developed a written script.

Over the longer term, most Turks converted to Islam. The earliest converts were Turkish nomads captured in border raids by forces of the Abbasid caliphate in the early ninth century and integrated into the caliphate’s armies as slave soldiers. The first large-scale conversion came in the late tenth century, when a Turkish ruling clan known as the Saljuqs turned to Islam and migrated to Iran in hopes of improving their fortunes through alliance with Abbasid authorities and service to the caliphate. Between the tenth and the fourteenth centuries, most Turkish clans on the steppes of central Asia also adopted Islam, and they carried the new faith with them when they expanded their political and military influence to new regions.

That expansion took place when nomadic leaders organized vast confederations of peoples all subject, at least nominally, to a khan (“ruler”). In fact, khans rarely ruled directly but, rather, ruled through the leaders of allied tribes. Yet when organized on a large scale, nomadic peoples wielded enormous military power, mostly because of their outstanding cavalry forces. Nomadic warriors learned to ride horses as children, and they had superior equestrian skills. Their arrows flew with deadly accuracy even when launched from the backs of galloping horses. Moreover, units of warriors coordinated their movements to outmaneuver and overwhelm their opponents.

Few armies were able to resist the mobility and discipline of well-organized nomadic warriors. When they found themselves at a disadvantage, they often were able to beat a hasty retreat and escape from their less speedy adversaries. With that military background, several groups of Turkish nomads began in the tenth century C.E. to seize the wealth of settled societies and build imperial states in the regions surrounding central Asia.

**Turkish Empires in Persia, Anatolia, and India**

Turkish peoples entered Persia, Anatolia, and India at different times and for different purposes. They approached Abbasid Persia much as Germanic peoples had earlier approached the Roman empire. From about the mid-eighth to the mid-tenth century, Turkish peoples lived mostly on the borders of the Abbasid realm, which offered abundant opportunities for trade. By the mid- to late tenth century, large numbers of Saljuq Turks served in Abbasid armies and lived in the Abbasid realm itself. By the mid-eleventh century the Saljuqs overshadowed the Abbasid caliphs. Indeed, in 1055 the
caliph recognized the Saljuq leader Tughril Beg as sultan ("chieftain" or "ruler"). Tughril first consolidated his hold on the Abbasid capital at Baghdad, then he and his successors extended Turkish rule to Syria, Palestine, and other parts of the realm. For the last two centuries of the Abbasid state, the caliphs served as figureheads of authority, whereas actual governance lay in the hands of the Turkish sultans.

While some Turkish peoples established themselves in Abbasid Persia, others turned their attention to the rich land of Anatolia, breadbasket of the Byzantine empire. Led by the Saljuqs, Turkish peoples began migrating into Anatolia in large numbers in the early eleventh century. In 1071 Saljuq forces inflicted a devastating defeat on the Byzantine army at Manzikert in eastern Anatolia and even took the Byzantine emperor captive. Following that victory Saljuqs and other Turkish groups entered Anatolia almost at will. The peasants of Anatolia, who mostly resented their Byzantine overlords, often looked upon the Saljuqs as liberators rather than conquerors.

The migrants thoroughly transformed Anatolia. Turkish groups displaced Byzantine authorities and set up their own political and social institutions. They levied taxes on the Byzantine church, restricted its activities, and sometimes confiscated church property. Meanwhile, they welcomed converts to Islam and made political, social, and economic opportunities available to them. By 1453, when Ottoman Turks captured the Byzantine capital at Constantinople, Byzantine and Christian Anatolia had become largely a Turkish and Islamic land.

While the Saljuqs spearheaded Turkish migrations in Abbasid Persia and Byzantine Anatolia, Mahmud of Ghazni led the Turkish Ghaznavids of Afghanistan in raids...
on lucrative sites in northern India. When the Ghaznavids began their campaigns in the early eleventh century, their principal goal was plunder. Gradually, though, they became more interested in permanent rule. They asserted their authority first over the Punjab and then over Gujarat and Bengal. By the thirteenth century, the Turkish sultanate of Delhi claimed authority over all of northern India. Several of the Delhi sultans conceived plans to conquer southern India and extend Muslim rule there, but none was able to realize those ambitions. The sultans faced constant challenges from Hindu princes in neighboring lands, and they periodically had to defend their northern frontiers from new Turkish or Mongol invaders. They maintained an enormous army with a large elephant corps, but those forces enabled them to hold on to their territories rather than to expand their empire.

Turkish rule had great social and cultural implications in India, as it did in Anatolia. Mahmud of Ghazni was a zealous foe of Buddhism and Hinduism alike, and he launched frequent raids on shrines, temples, and monasteries. His forces stripped Buddhist and Hindu establishments of their wealth, destroyed their buildings, and often slaughtered their residents and attendants as well. As Turkish invaders repressed Buddhism and Hinduism, they encouraged conversion to Islam and enabled their faith to establish a secure presence in northern India.

Though undertaken by different groups, for different reasons, and by different means, the Turkish conquests of Persia, Anatolia, and India represented part of a larger expansive movement by nomadic peoples. In all three cases the formidable military prowess of Turkish peoples enabled them to move beyond the steppe lands of central Asia and dominate settled societies. By the thirteenth century, the influence of nomadic peoples was greater than ever before in Eurasian history. Yet the Turkish conquests represented only a prelude to an astonishing round of empire building launched by the Mongols during the thirteenth and fourteenth centuries.
CHAPTER 18 | Nomadic Empires and Eurasian Integration

The Mongol Empires

For most of history the nomadic Mongols lived on the high steppe lands of eastern central Asia. Like other nomadic peoples, they displayed deep loyalty to kin groups organized into families, clans, and tribes. They frequently allied with Turkish peoples who built empires on the steppes, but they rarely played a leading role in the organization of states before the thirteenth century. Strong loyalties to kinship groups made it difficult for the Mongols to organize a stable society on a large scale. During the early thirteenth century, however, Chinggis Khan (sometimes spelled “Genghis Khan”) forged the various Mongol tribes into a powerful alliance that built the largest empire the world has ever seen. Although the vast Mongol realm soon dissolved into a series of smaller empires—most of which disappeared within a century—the Mongols’ imperial venture brought the societies of Eurasia into closer contact than ever before.

Chinggis Khan and the Making of the Mongol Empire

The unifier of the Mongols was Temüjin, born about 1167 into a noble family. His father was a prominent warrior who forged an alliance between several Mongol clans and seemed likely to become a powerful leader. When Temüjin was about ten years old, however, rivals poisoned his father and destroyed the alliance. Abandoned by his father’s allies, Temüjin led a precarious existence for some years. He lived in poverty, since rivals seized the family’s animals, and several times he eluded enemies seeking to eliminate him as a potential threat to their own ambitions. A rival once captured him and imprisoned him in a wooden cage, but Temüjin made a daring midnight escape and regained his freedom.

During the late twelfth century, Temüjin made an alliance with a prominent Mongol clan leader. He also mastered the art of steppe diplomacy, which called for displays of personal courage in battle, combined with intense loyalty to allies—as well as a willingness to betray allies or superiors to improve one’s position—and the ability to entice previously unaffiliated tribes into cooperative relationships. Temüjin gradually strengthened his position, sometimes by forging useful alliances, often by conquering rival contenders for power, and occasionally by turning suddenly against a troublesome ally. He eventually brought all the Mongol tribes into a single confederation, and in 1206 an assembly of Mongol

This painting by a Chinese artist depicts Chinggis Khan at about age sixty. Though most of his conquests were behind him, Chinggis Khan’s focus and determination are readily apparent in this portrait.
leaders recognized Temüjin’s supremacy by proclaiming him Chinggis Khan (“universal ruler”).

Chinggis Khan’s policies greatly strengthened the Mongol people. Earlier nomadic state builders had ruled largely through the leaders of allied tribes. Because of his personal experiences, however, Chinggis Khan mistrusted the Mongols’ tribal organization. He broke up the tribes and forced men of fighting age to join new military units with no tribal affiliations. He chose high military and political officials not on the basis of kinship or tribal status but, rather, because of their talents or their loyalty to him. Although he spent most of his life on horseback, Chinggis Khan also established a capital at Karakorum—present-day Har Horin, located about 300 kilometers (186 miles) west of the modern Mongolian capital of Ulaanbaatar—where he built a luxurious palace. As command center of Chinggis Khan’s empire, Karakorum symbolized a source of Mongol authority superior to the clan or tribe. Chinggis Khan’s policies created a Mongol state that was not only much stronger than any earlier nomadic confederation but also less troubled by conflicts between clans and tribes.

The most important institution of the Mongol state was the army, which magnified the power of the small population. In the thirteenth century the Mongol population stood at about one million people—less than 1 percent of China’s numbers. During Chinggis Khan’s life, his army numbered only 100,000 to 125,000 Mongols, although allied peoples also contributed forces. How was it possible for so few people to conquer the better part of Eurasia?

Like earlier nomadic armies, Mongol forces relied on outstanding equestrian skills. Mongols grew up riding horses, and they honed their skills by hunting and playing competitive games on horseback. Their bows, short enough for archers to use while riding, were also stiff, firing arrows that could fell enemies at 200 meters (656 feet). Mongol horsemen were among the most mobile forces of the premodern world, sometimes traveling more than 100 kilometers (62 miles) per day to surprise an enemy. Furthermore, the Mongols understood the psychological dimensions of warfare and used them to their advantage. If enemies surrendered without resistance, the Mongols usually spared their lives, and they provided generous treatment for artisans, crafts workers, and those with military skills. In the event of resistance, however, the Mongols ruthlessly slaughtered whole populations, sparing only a few, whom they sometimes drove before their armies as human shields during future conflicts.
Once he had united the Mongols, Chinggis Khan turned his army and his attention to other parts of central Asia and particularly to nearby settled societies. He attacked the various Turkish peoples ruling in Tibet, northern China, Persia, and the central Asian steppes. His conquests in central Asia were important because they protected him against the possibility that other nomadic leaders might challenge his rule. But the Mongol campaigns in China and Persia had especially far-reaching consequences.

Chinggis Khan himself extended Mongol rule to northern China, dominated since 1127 C.E. by the nomadic Jurchen people, while the Song dynasty continued to rule

---

**Sources from the Past**

**Marco Polo on Mongol Military Tactics**

*The Venetian Marco Polo traveled extensively through central Asia and China in the late thirteenth century, when Mongol empires dominated Asia. His book of travel writings is an especially valuable source of information about the Mongol age. Among other things, he described the Mongol way of making war.*

Their arms are bows and arrows, sword and mace; but above all the bow, for they are capital archers, indeed the best that are known. . . .

When a Mongol prince goes forth to war, he takes with him, say, 100,000 men. Well, he appoints an officer to every ten men, one to every hundred, one to every thousand, and one to every ten thousand, so that his own orders have to be given to ten persons only, and each of these ten persons has to pass the orders only to another ten, and so on, no one having to give orders to more than ten. And every one in turn is responsible only to the officer immediately over him; and the discipline and order that comes of this method is marvellous, for they are a people very obedient to their chiefs. . . .

When they are going on a distant expedition they take no gear with them except two leather bottles for milk, a little earthenware pot to cook their meat in, and a little tent to shelter them from rain. And in case of great urgency they will ride ten days on end without lighting a fire or taking a meal. On such an occasion they will sustain themselves on the blood of their horses, opening a vein and letting the blood jet into their mouths, drinking till they have had enough, and then staunching it. . . .

When they come to an engagement with the enemy, they will gain the victory in this fashion. They never let themselves get into a regular medley, but keep perpetually riding round and shooting into the enemy. And as they do not count it any shame to run away in battle, they will sometimes pretend to do so, and in running away they turn in the saddle and shoot hard and strong at the foe, and in this way make great havoc. Their horses are trained so perfectly that they will double hither and thither, just like a dog, in a way that is quite astonishing. Thus they fight to as good purpose in running away as if they stood and faced the enemy because of the vast volleys of arrows that they shoot in this way, turning round upon their pursuers, who are fancying that they have won the battle. But when the Mongols see that they have killed and wounded a good many horses and men, they wheel round bodily and return to the charge in perfect order and with loud cries, and in a very short time the enemy are routed. In truth they are stout and valiant soldiers, and inured to war. And you perceive that it is just when the enemy sees them run, and imagines that he has gained the battle, that he has in reality lost it, for the Mongols wheel round in a moment when they judge the right time has come. And after this fashion they have won many a fight.

**FOR FURTHER REFLECTION**

In what ways do the military practices described by Marco Polo reflect the influence of the steppe environment on the Mongols?

in southern China. The conquest of China began in 1211 C.E. when Mongol raiding parties invaded the Jurchen realm. Raids quickly became more frequent and intense, and soon they developed into a campaign of conquest. By 1215 the Mongols had captured the Jurchen capital near modern Beijing, which under the new name of Khanbaliq ("city of the khan") served also as the Mongol capital in China. Fighting between Mongols and Jurchen continued until 1234, but by 1220 the Mongols had largely established control over northern China.

While part of his army consolidated the Mongol hold on northern China, Chinggis Khan led another force to Afghanistan and Persia, ruled at that time by a successor to the Saljuqs known as the Khwarazm shah. In 1218 Chinggis Khan sought to open trade and diplomatic relations with the Khwarazm shah. The shah despised the Mongols, however, and he ordered his officials to murder Chinggis Khan's envoys and the merchants accompanying them. The following year Chinggis Khan took his army west to seek revenge. Mongol forces pursued the Khwarazm shah to an island in the Caspian Sea, where he died. Meanwhile, they shattered the shah's army and seized control of his realm.

To forestall any possibility that the shah's state might survive and constitute a challenge to his own empire, Chinggis Khan wreaked destruction on the conquered land. The Mongols ravaged one city after another, demolishing buildings and massacring hundreds of thousands of people. Some cities never recovered. The Mongols also destroyed the delicate qanat irrigation systems that sustained agriculture in the arid region, resulting in severely reduced agricultural production. For centuries after the Mongol conquest, Persian chroniclers cursed the invaders and the devastation they had visited upon the land.

By the time of his death in 1227, Chinggis Khan had laid the foundation of a vast and mighty empire. He had united the Mongols, established Mongol supremacy in central Asia, and extended Mongol control to northern China in the east and Persia in the west. Chinggis Khan was a conqueror, however, not an administrator. He ruled the Mongols through his control over the army, but he did not establish a central government for the lands that he conquered. Instead, he assigned Mongol overlords to supervise local administrators and to extract a generous tribute for the Mongols' own uses. Chinggis Khan's heirs continued his conquests, but they also undertook the task of designing a more permanent administration to guide the fortunes of the Mongol empire.

**The Mongol Empires after Chinggis Khan**

Chinggis Khan's death touched off a struggle for power among his sons and grandsons, several of whom had ambitions to succeed the great khan. Eventually, his heirs divided Chinggis Khan's vast realm into four regional empires. The great khans ruled China, the wealthiest of Mongol lands. Descendants of Chaghatai, one of Chinggis Khan's sons, ruled the khanate of Chaghatai in central Asia. Persia fell under the authority of rulers known as the ilkhans, and the khans of the Golden Horde dominated Russia. The great khans were nominally superior to the others, but they were rarely able to enforce their claims to authority. In fact, for as long as the Mongol empires survived, ambition fueled constant tension and occasional conflict among the four khans.

The consolidation of Mongol rule in China came during the reign of Khubilai (sometimes spelled Qubilai), one of Chinggis Khan’s grandsons. Khubilai was perhaps the most talented of the great conqueror's descendants. He unleashed ruthless
attacks against his enemies, but he also took an interest in cultural matters and worked to improve the welfare of his subjects. He actively promoted Buddhism, and he provided support also for Daoists, Muslims, and Christians in his realm. The famous Venetian traveler Marco Polo, who lived almost two decades at Khubilai’s court, praised him for his generosity toward the poor and his efforts to build roads. Though named great khan in 1260, Khubilai spent four years fighting off contenders. From 1264 until his death in 1294, Khubilai Khan presided over the Mongol empire at its height.

Khubilai extended Mongol rule to all of China. From his base at Khanbaliq, he relentlessly attacked the Song dynasty in southern China. The Song capital at Hangzhou fell to Mongol forces in 1276, and within three years Khubilai had eliminated resistance throughout China. In 1279 he proclaimed himself emperor and established the Yuan dynasty, which ruled China until its collapse in 1368.

Beyond China, Khubilai had little success as a conqueror. During the 1270s and 1280s, he launched several invasions of Vietnam, Cambodia, and Burma as well as a naval expedition against Java involving five hundred to one thousand ships and twenty thousand troops. But Mongol forces did not adapt well to the humid, tropical jungles of southeast Asia. Pasturelands were inadequate for their horses, and the fearsome Mongol horsemen were unable to cope with the guerilla tactics employed by the defenders. In 1274 and again in 1281, Khubilai also attempted seaborne invasions of Japan, but on both occasions typhoons thwarted his plans. The storm of 1281 was especially vicious: it destroyed about 4,500 Mongol vessels carrying more than one hundred thousand armed troops—the largest seaborne expedition before World War II. Japanese defenders attributed their continued independence to the kami kaze (“divine winds”).

Map 18.2 The Mongol empires, ca. 1300 C.E. The Mongol empires stretched from Manchuria and China to Russia and eastern Europe. In what ways did Mongol empires and Mongol policies facilitate trade, travel, and communication throughout Eurasia?
PART IV | An Age of Cross-Cultural Interaction, 1000 to 1500 C.E.

As Khubilai consolidated his hold on east Asia, his cousins and brothers tightened Mongol control on lands to the west. Mongols of the group known as the Golden Horde overran Russia between 1237 and 1241 and then mounted exploratory expeditions into Poland, Hungary, and eastern Germany in 1241 and 1242. Mongols of the Golden Horde prized the steppes north of the Black Sea as prime pastureland for their horses. They maintained a large army on the steppes, from which they mounted raids into Russia. They did not occupy Russia, which they regarded as an unattractive land of forests, but they extracted tribute from the Russian cities and agricultural provinces. The Golden Horde maintained its hegemony in Russia until the mid-fifteenth century, when the princes of Moscow rejected its authority while building a powerful Russian state. By the mid-sixteenth century Russian conquerors had extended their control to the steppes, but Mongol khans descended from the Golden Horde continued to rule the Crimea until the late eighteenth century.

While the Golden Horde established its authority in Russia, Khubilai’s brother Hülegü toppled the Abbasid empire and established the Mongol ilkhanate in Persia. In 1258 he captured the Abbasid capital of Baghdad after a brief siege. His troops looted the city, executed the caliph, and massacred more than two hundred thousand residents by Hülegü’s estimate. From Persia, Hülegü’s army ventured into Syria, but Muslim forces from Egypt soon expelled them and placed a limit on Mongol expansion to the southwest.

When the Mongols crushed ruling regimes in large settled societies, particularly in China and Persia, they discovered that they needed to become governors as well as conquerors. The Mongols had no experience administering complex societies, where successful governance required talents beyond the equestrian and military skills esteemed on the steppes. They had a difficult time adjusting to their role as administrators. Indeed, they never became entirely comfortable in the role, and most of their conquests fell out of their hands within a century.

The Mongols adopted different tactics in the different lands that they ruled. In Persia they made important concessions to local interests. Although Mongols and their allies occupied the highest administrative positions, Persians served as ministers, provincial governors, and state officials at all lower levels. The Mongols basically allowed the Persians to administer the ilkhanate as long as they delivered tax receipts and maintained order.
Over time, the Mongols even assimilated to Persian cultural traditions. The early Mongol rulers of Persia mostly observed their native shamanism, but they tolerated all religions—including Islam, Nestorian Christianity, Buddhism, and Judaism—and they ended the privileges given Muslims during the Abbasid caliphate. Gradually, however, the Mongols themselves gravitated toward Islam. In 1295 Ilkhan Ghazan publicly converted to Islam, and most of the Mongols in Persia followed his example. Ghazan’s conversion sparked large-scale massacres of Christians and Jews, and it signaled the return of Islam to a privileged position in Persian society. It also indicated the absorption of the Mongols into Muslim Persian society.

In China, in contrast, the Mongol overlords stood aloof from their subjects, whom they scorned as mere cultivators. They outlawed intermarriage between Mongols and Chinese and forbade the Chinese to learn the Mongol language. Soon after their conquest some of the victors went so far as to suggest that the Mongols exterminate the Chinese people and convert China itself into pastureland for their horses. Cooler heads eventually prevailed, and the Mongols decided simply to extract as much revenue as possible from their Chinese subjects. In doing so, however, they did not make as much use of native administrative talent as did their counterparts in Persia. Instead, they brought foreign administrators into China and put them in charge. Along with their nomadic allies, the Mongols’ administrative staff included Arabs, Persians, and perhaps even Europeans: Marco Polo may have served as an administrator in the city of Yangzhou during the reign of Kubilai Khan.

The Mongols also resisted assimilation to Chinese cultural traditions. They ended the privileges enjoyed by the Confucian scholars, and they dismantled the Confucian educational and examination system, which had produced untold generations of civil servants for the Chinese bureaucracy. They did not persecute Confucians, but they
allowed the Confucian tradition to wither in the absence of official support. Meanwhile, to remain on good terms with subjects of different faiths, the Mongols allowed the construction of churches, temples, and shrines, and they even subsidized some religious establishments. They tolerated all cultural and religious traditions in China, including Confucianism, Daoism, Buddhism, and Christianity. Of Khubilai Khan’s four wives, his favorite was Chabi, a Nestorian Christian.

For their part the Mongols mostly continued to follow their native shamanist cults, although many of the ruling elite became enchanted with the Lamaist school of Buddhism that developed in Tibet. Lamaist Buddhism held several attractions for the Mongols. It made a prominent place for magic and supernatural powers, and in that respect it resembled the Mongols’ shamanism. Moreover, Lamaist Buddhist leaders officially recognized the Mongols as legitimate rulers and went out of their way to court the Mongols’ favor. They numbered the Mongols in the ranks of universal Buddhist rulers and even recognized the Mongol khans as incarnations of the Buddha. Thus it is not surprising that the Mongol ruling elites would find Lamaist Buddhism attractive.

The Mongols and Eurasian Integration

In building their vast empire, the Mongols brought tremendous destruction to lands throughout much of the Eurasian landmass. Yet they also sponsored interaction among peoples of different societies and linked Eurasian lands more directly than ever before. Indeed, Mongol rulers positively encouraged travel and communication over long distances. Recognizing the value of regular communications for their vast empire, Chinggis Khan and his successors maintained a courier network that rapidly relayed news, information, and government orders. The network included relay stations with fresh horses and riders so that messages could travel almost nonstop throughout Mongol territories. The Mongols’ encouragement of travel and communication facilitated trade, diplomatic travel, missionary efforts, and movements of peoples to new lands.

As a nomadic people dependent on commerce with settled agricultural societies, the Mongols worked to secure trade routes and ensure the safety of merchants passing through their territories. The Mongol khans frequently fought among themselves, but they maintained reasonably good order within their realms and allowed merchants to travel unmolested through their empires. As a result, long-distance travel and trade became much less risky than in earlier times. Merchants increased their commercial investments, and the volume of long-distance trade across central Asia dwarfed that of earlier eras. Lands as distant as China and western Europe became directly linked for the first time because of the ability of individuals to travel across the entire Eurasian landmass.

Like trade, diplomatic communication was essential to the Mongols, and their protection of roads and travelers benefited ambassadors as well as merchants. Chinggis Khan destroyed the Khwarazm shah in Persia because the shah unwisely murdered the Mongol envoys Chinggis Khan dispatched in hopes of opening diplomatic and commercial relations. Throughout the Mongol era the great khans in China, the ilkhans in Persia, and the other khans maintained close communications by means of diplomatic embassies. They also had diplomatic dealings with rulers in Korea, Vietnam, India, western Europe, and other lands as well. Some diplomatic travelers crossed the entire Eurasian landmass. Several European ambassadors traveled to Mongolia and China to deliver messages from authorities seeking to ally with the Mongols against Muslim states in southwest Asia. Diplomats also traveled west: Rabban Sauma, a Nestorian
Christian monk born in Khanbaliq, visited Italy and France as a representative of the Persian ilkhan.

Like the silk roads in earlier times, Eurasian routes during the era of the Mongol empires served as highways for missionaries as well as merchants and diplomats. Sufi missionaries helped popularize Islam among Turkish peoples in central Asia, while Lamaist Buddhism from Tibet attracted considerable interest among the Mongols. Nestorian Christians, who had long been prominent in oasis communities throughout central Asia, found new opportunities to win converts when they went to China to serve as administrators for Mongol rulers there. Roman Catholic Christians also mounted missionary campaigns in China. (See chapter 22 for further discussion of travel during the Mongol era.)

Another Mongol policy that encouraged Eurasian integration was the practice of resettling peoples in new lands. As a nomadic people, the Mongols had limited numbers of skilled artisans and educated individuals, but the more their empire expanded, the more they needed the services of specialized crafts workers and literate administrators. Mongol overlords recruited the talent they needed largely from the ranks of their allies and the peoples they conquered, and they often moved people far from their homelands to sites where they could best make use of their services. Among the most important of the Mongols’ allies were the Uighur Turks, who lived mostly in oasis cities along the silk roads. The Uighurs were literate and often highly educated, and they provided not only many of the clerks, secretaries, and administrators who ran the Mongol empires but also units of soldiers who bolstered Mongol garrisons. Arab and Persian Muslims were also prominent among those who administered the Mongols’ affairs far from their homelands.

Conquered peoples also supplied the Mongols with talent. When they overcame a city, Mongol forces routinely surveyed the captured population, separated out those with specialized skills, and sent them to the capital at Karakorum or some other place where there was demand for their services. From the ranks of conquered peoples came soldiers, bodyguards, administrators, secretaries, translators, physicians, armor makers, metalsmiths, miners, carpenters, masons, textile workers, musicians, and jewelers. After the 1230s the Mongols often took censuses of lands they conquered, partly to levy taxes and conscript military forces and partly to locate talented individuals. The Parisian goldsmith Guillaume Boucher was only one among thousands of foreign-born individuals who became permanent residents of the Mongol capital at Karakorum because of their special talents. Like their protection of trade and diplomacy, the Mongols’ policy of resettling allies and conquered peoples promoted Eurasian integration by increasing communication and exchange between peoples of different societies.

### Decline of the Mongols in Persia and China

Soon after the long and prosperous reign of Khubilai Khan, the Mongols encountered serious difficulties governing Persia and China. In Persia excessive spending strained the treasury, and overexploitation of the peasantry led to reduced revenues. In the early 1290s the ilkhan tried to resolve his financial difficulties by introducing paper money and ordering all subjects to accept it for payment of all debts. The purpose of that measure was to drive precious metals into the hands of the government, but the policy was a miserable failure: rather than accept paper that they regarded as worthless, merchants simply closed their shops. Commerce ground to a halt until the ilkhan rescinded his order. Meanwhile, factional struggles plagued the Mongol leadership. The regime went into steep decline after the death of Ilkhan Ghazan in 1304. When the last of the Mongol rulers died without an heir in 1335, the ilkhanate itself...
simply collapsed. Government in Persia devolved to local levels until late in the fourteenth century when Turkish peoples reintroduced effective central government.

Mongol decline in China was a more complicated affair. As in Persia, it had an economic dimension. The Mongols continued to use the paper money that the Chinese had introduced during the Tang and Song dynasties, but they did not maintain adequate reserves of the bullion that backed up paper notes. The general population soon lost confidence in paper money, and prices rose sharply as a reflection of its diminished value. As in Persia, too, factions and infighting hastened Mongol decline in China. As the richest of the Mongol empires, China attracted the attention of ambitious warriors. Beginning in the 1320s power struggles, imperial assassinations, and civil war convulsed the Mongol regime in China.

Apart from financial difficulties and factional divisions, the Mongol rulers of China also faced an onslaught of epidemic disease. By facilitating trade and communications throughout Eurasia, the Mongols unwittingly expedited the spread of bubonic plague (discussed in chapter 22). During the 1330s plague erupted in southwestern China. From there it spread throughout China and central Asia, and by the late 1340s it had reached southwest Asia and Europe, where it became known as the Black Death. Bubonic plague sometimes killed half or more of an exposed population, particularly during the furious initial years of the epidemic, and it seriously disrupted economies and societies throughout much of Eurasia. In China depopulation and labor shortages that followed on the heels of epidemic plague weakened the Mongol regime. (Plague would also have caused serious problems for the Mongol rulers of Persia had the ilkhanate not collapsed before its arrival.)

The Mongols also faced a rebellious subject population in China. The Mongols stood apart from their Chinese subjects, who returned the contempt of their conquerors. Beginning in the 1340s southern China became a hotbed of peasant rebellion and banditry, which the Mongols could not control. In 1368 rebel forces captured Khanbaliq, and the Mongols departed China en masse and returned to the steppes.

Despite the collapse of the Mongol regimes in Persia and China, Mongol states did not completely disappear. The khanate of Chaghatai continued to prevail in central Asia, and Mongols posed a threat to the northwestern borders of China until the eighteenth century. Meanwhile, the khanate of the Golden Horde continued to dominate the Caucasus and the steppe lands north of the Black Sea and the Caspian Sea until the mid-sixteenth century, when a resurgent Russian state brought the Golden Horde down. Like Mongols in China, however, Mongols in Russia continued to threaten until the eighteenth century, and Mongols who had settled in the Crimean peninsula retained their identity until Joseph Stalin forcibly moved them to other parts of the Soviet Union in the mid-twentieth century.

**After the Mongols**

By no means did the decline of the Mongols signal the end of nomadic peoples’ influence in Eurasia. As Mongol strength waned, Turkish peoples resumed the expansive campaigns that the Mongols had interrupted. During the late fourteenth and early fifteenth centuries, the Turkish conqueror Tamerlane built a central Asian empire rivaling that of Chinggis Khan. Although Tamerlane’s empire foundered soon after his death, it deeply influenced three surviving Turkish Muslim states—the Mughal empire in India, the Safavid empire in Persia, and the Ottoman empire based in Anatolia—and also embraced much of southwest Asia, southeastern Europe, and north Africa.
The rapid collapse of the Mongol states left gaping power vacuums in China and Persia. While the native Ming dynasty filled the vacuum in China, a self-made Turkish conqueror named Timur moved on Persia. Because he walked with a limp, contemporaries referred to him as Timur-i-lang—"Timur the Lame"—an appellation that made its way into English as Tamerlane.

Born about 1336 near Samarkand, Tamerlane took Chinggis Khan as his model. Like Chinggis Khan, Tamerlane came from a family of the minor nobility and had to make his own way to power. Like Chinggis Khan, too, he was a charismatic leader and a courageous warrior, and he attracted a band of loyal followers. During the 1360s he eliminated rivals to power, either by persuading them to join him as allies or by defeating their armies on the battlefield, and he won recognition as leader of his own tribe. By 1370 he had extended his authority throughout the khanate of Chaghatai and begun to build a magnificent imperial capital in Samarkand.

For the rest of his life, Tamerlane led his armies on campaigns of conquest. He turned first to the region between Persia and Afghanistan, and he took special care to establish his authority in the rich cities so that he could levy taxes on trade and agricultural production. Next he attacked the Golden Horde in the Caucasus region and Russia, and by the mid-1390s he had severely weakened it. During the last years of the century, he invaded India and subjected Delhi to a ferocious sack: contemporary chroniclers reported, with some exaggeration, that for a period of two months after the attack not even birds visited the devastated city. Later Tamerlane campaigned along the Ganges, although he never attempted to incorporate India into his empire. He opened the new century with campaigns in southwest Asia and Anatolia. In 1404 he began preparations for an invasion of China, and he was leading his army east when he fell ill and died in 1405.

Like his model Chinggis Khan, Tamerlane was a conqueror, not a governor. He spent almost his entire adult life planning and fighting military campaigns: he even had himself carried around on a litter during his final illness, as he prepared to invade China. He did not create an imperial administration but, rather, ruled through tribal leaders who were his allies. He appointed overlords in the territories he conquered, but they relied on existing bureaucratic structures and simply received taxes and tributes on his behalf.

Given its loose organization, it is not surprising that Tamerlane’s empire experienced stresses and strains after the conqueror’s death. Tamerlane’s sons and grandsons
engaged in a long series of bitter conflicts that resulted in the contraction of his empire and its division into four main regions. For a century after Tamerlane’s death, however, they maintained control over the region from Persia to Afghanistan. When the last vestiges of Tamerlane’s imperial creation disappeared, in the early sixteenth century, the Mughal, Safavid, and Ottoman empires that replaced it all clearly reflected the Turkish Muslim legacy of the lame conqueror.

The Foundation of the Ottoman Empire

Chapter 28 will discuss the Mughal empire in India and the Safavid empire in Persia, both of which emerged during the early sixteenth century as Tamerlane’s empire finally dissolved. The early stages of Ottoman expansion predated Tamerlane, however, and the foundation of the Ottoman empire throws additional light on the influence of nomadic peoples during the period 1000 to 1500 C.E.

After the Mongol conquest of Persia, large numbers of nomadic Turks migrated from central Asia to the ilkhanate and beyond to the territories in Anatolia that the Saljuq Turks had seized from the Byzantine empire. There they followed charismatic leaders who organized further campaigns of conquest. Among those leaders was Osman, who during the late thirteenth and early fourteenth centuries carved a small state for himself in northwestern Anatolia. In 1299 Osman declared independence from the Saljuq sultan and launched a campaign to build a state at the expense of the Byzantine empire. After every successful operation Osman attracted more and more followers, who came to be known as Osmanlis or Ottomans.
During the 1350s the Ottomans gained a considerable advantage over their Turk-
ish rivals when they established a foothold across the Dardanelles at Gallipoli on the
Balkan peninsula. The Ottomans quickly moved to expand the boundaries of their
Balkan holdings. Byzantine forces resisted Ottoman incursions, but because of politi-
cal fragmentation, ineffective government, and exploitation of the peasantry, the Otto-
mans found abundant local support. By the 1380s the Ottomans had become by far
the most powerful people on the Balkan peninsula, and by the end of the century they
were poised to capture Constantinople and take over the Byzantine empire.

Tamerlane temporarily delayed Ottoman expansion in the Byzantine realm. In
1402 Tamerlane’s forces crushed the Ottoman army, captured the sultan, and sub-
jected the Ottoman state to the conqueror’s authority. After Tamerlane’s death, Otto-
man leaders had to reestablish their rule in their own realm. This undertaking
involved both the repression of ambitious local princes who sought to build power
bases at Ottoman expense and the defense of Ottoman territories against Byzantine,
Venetian, and other Christian forces that sought to turn back the advance of the
Turkish Muslims. By the 1440s the Ottomans had recovered their balance and begun
again to expand in the Byzantine empire.
The campaign culminated in 1453 when Sultan Mehmed II, known as Mehmed the Conqueror, captured the Byzantine capital of Constantinople. After subjecting it to a sack, he made the city his own capital under the Turkish name of Istanbul. With Istanbul as a base, the Ottomans quickly absorbed the remainder of the Byzantine empire. By 1480 they controlled all of Greece and the Balkan region. They continued to expand throughout most of the sixteenth century as well, extending their rule to southwest Asia, southeastern Europe, Egypt, and north Africa. Once again, then, a nomadic people asserted control over a long-settled society and quickly built a vast empire.

During the half millennium from 1000 to 1500 C.E., nomadic peoples of central Asia played a larger role than ever before in world history. As early as the second millennium B.C.E., they had periodically threatened states from China to the eastern Mediterranean region, and from classical times they had traded regularly and actively with peoples of settled societies. From 1000 to 1500 their relations with neighboring peoples changed, as they dominated affairs in most of Eurasia through their conquests and their construction of vast transregional empires. Turkish peoples built the most durable of the nomadic empires, but the spectacular conquests of the Mongols most clearly demonstrated the potential of nomadic peoples to project their formidable military power to settled agricultural societies. By establishing connections that spanned the Eurasian landmass, the nomadic empires laid the foundation for increasing communication, exchange, and interaction among peoples of different societies and thereby fostered the integration of the eastern hemisphere. The age of nomadic empires, from 1000 to 1500 C.E., foreshadowed the integrated world of modern times.
